

Assignment Code: FSD-O-ASG-03

CSS Basics | Assignment

Question 1: You are building a landing page for a small bakery in your city. The page looks fine on your laptop but when you open it on your phone, the text is too small and the images go outside the screen. Which CSS technique will you use to fix this and how will you start?

Answer

We should make our page responsive and make it fine for phone. We should use **media query** and add code to make sure page should look good and accessible on phone

Question 2: You added a navbar at the top of your website. The client wants the navbar to always stay visible at the top, even when the user scrolls down. Which CSS property will you use and what value will you set?

Answer

I will use the position property **sticky** and give value like top:0%.
We can also use **fixed** position

Question 3: You wrote CSS for a button — first you added a class .btn with blue background, then added an id #submitBtn with red background to the same button. The button is showing red instead of blue. Why is this happening?

Answer

Because **id** has more **priority** than **class** so its is overriding class and showing red colour.

Question 4: You are building a product card for an online store. You want three cards to sit side by side on desktop, but stack one below the other on mobile. Which layout system will you use and how will you make it responsive?

Answer

I will use **media query** select mobile size and write different css for mobile devics so it can look different on moile and pc.

Question 5: You have a section with text and you want to add some space inside the section between the text and the border, and also some space outside the section to separate it from the next section. Which two CSS properties will you use and how will they differ?

Answer

For space inside the section I will use the property **padding** to add space inside. For space from next section I will use **margin**.

Question 6: Your senior gives you a design where a 'SALE' label has to sit on the top-right corner of every product image. The label should overlap the image. Which positioning approach will you use?

Answer

For this I will use relative position and give negative value for left margin and top margin.

Question 7: What is the difference between display: none and visibility: hidden? Give one situation where you would use each.

Answer

The core difference is that display: none completely removes an element from the document layout, allowing surrounding elements to collapse and fill its space. In contrast, visibility: hidden makes the element invisible but preserves the exact amount of space it takes up.

Question 8: What is the difference between Flexbox and CSS Grid? When should you use each?

Answer

Flexbox is **one-dimensional** (handling either a row *or* a column at a time), while CSS Grid is **two-dimensional** (handling rows *and* columns simultaneously).

Question 9: What are the three ways to add CSS to an HTML page? Which one is preferred for real projects and why?

Answer

Three ways are : Inline Internal External
For real projects external css is preferred it keeps design and basic code different and increases readability of code.

What is a media query in CSS? Write a small example that changes the background color when the screen is smaller than 600px.

Answer

A **media query** is a CSS technique used to apply different styles depending on the device's characteristics, such as screen width, resolution, or orientation.

```
@media screen and (max-width: 600px) { body { background-color: lightcoral; } }
```
